"Tick histamine-binding proteins: isolation, cloning, and three-dimensional structure";

Mol. Cell 3:661-671(1999).

-i- FUNCTION: BINDS HISTAMINE WITH A HIGH-AFFINITY. THE ABILITY TO OUTCOMPETE HISTAMINE RECEPTORS INDICATES THAT ITS FUNCTION IS SUPPRESS INFLAMMATION DURING BLOOD FEEDING.
```

Natl. Acad. Sci. U.S.A. 97:14257-14262(2000).

-I- FUNCTION: One of the primary rRNA binding proteins, it binds directly to 165 rRNA where it nucleates assembly of the body of the 30S subunit (By similarity).

-I- FUNCTION: With $5 and $12 plays an important role in translation.
                                                                                                                                                                                                                                                                                                                                                   use by non-profit institutions as long modified and this statement is not removed entitles requires a license agreement (See or send an email to license@isb-sib.ch).

SUBUNIT: Part of the 30S ribosomal subunit. Contacts protein The interaction surface between $4 and $5 is involved in confort translational fidelity (By similarity).

SIMILARITY: Contains 1 $4 RNA binding domain.

SIMILARITY: BELONGS TO THE $4P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ribosomal protein 54P.

Nucleic Acids Res. 24:4420-4449(1996).

Nucleic Acids Res. 24:4420-4449(1996).

-I- FUNCTION: PART OF THE BINDING-PROTEIN-DEPENDENT TRANSPORT SYSTEM FOR OLIGOPEPTIDES. PROBABLY RESPONSIBLE FOR ENERGY COUPLING TO THE TRANSPORT SYSTEM (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: Membrane-associated (Potential).

-I- SIMILARITY: Belongs to the ABC transporter family.

DISEASE: Defects in ATRX are the cause of Juberg-Warsidi syndrome (JW) [WIM:309590]. JM is a rare X-linked recessive disease characterized by severe mental retardation, growth failure, sensorineural deafness, microgenitalism and early death.

SIMILARITY: BELONGS TO THE SNF2/RAD54 HELICASE FAMILY.

SIMILARITY: Contains 1 PHD-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE SPECIFICITY: Ubiquitous.

DISEASE: Defects in ATRX are the cause of X-linked alphathalasemia/mental retardation syndrome (ATR-X) [MIM:301040]. ATR-X is an X-linked disorder comprising severe psychomotor x is an X-linked disorder comprising severe psychomotor retardation, facial dysmorphism, urogenital abnormalities, and retardation, facial dysmorphism, urogenital abnormalities, and retardation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      paraplegia, microcephaly, short stature and cryptorchidism. DISEASE: Defects in ATRX are a cause of Smith-Fineman-Myers syndrome (SEM) [MIM:309580]. Clinical features include severe mental retardation, microcephaly, growth failure, facial anomalies and bilateral cryptorchidism. Due to the clinical overlap with ATR-X syndrome, some patients originally diagnosed as having SEM, might be affected by a variant of ATR-X syndrome which lack
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         erythrocyte inclusions.

DISEASE: Defects in ATRX are the cause of Sutherland-Haan mental retardation syndrome (SHS) [MIM:309470]. It is characterized by severe mental retardation with spastic characterized by severe mental retardation with spastic characterized by severe mental retardation with spastic characterized by severe mental retardation and counterpolations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hemoglobin h inclusions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   retardation, facial dysmorphism, urogenital abnormalities, and alpha-thalassemia. An essential phenotypic trait are hemoglobin

FUNCTION: Silding clamp subunit. Responsible catalytic subunit of DNA polymerase to DNA replication (By similarity).

SUBUNIT: Homotrimer (By similarity).

SIMILARITY: BELONGS TO THE PCNA FAMILY.

1 PUNCTION: INVOLVED IN THE INTRACELLULAR SORTING AND DELIVERY OF SOLUBLE VACUOLAR PROTEINS, SEEMS TO SPECIFICALLY INTERACT WITH CARBOXYPEPTIDASE Y (CPY). MAY EXECUTE MULTIPLE ROUNDS OF SORTING BY CYCLING BETWEEN THE LATE GOLGI AND A PREVACUOLAR ENDOSOME-LIKE COMPARTMENT. BINDS THE GOLGI-MODIFIED P2 FORM OF CPY, AND THIS INVERACTION IS DEPENDENT ON THE PRESENCE OF AN INTACT CPY VACUOLAR PROTEIN SORTING SIGNAL.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: It is thought that the P2C protein attaches to vesicular membranes and is associated with viral RNA synthesis.

CATALYTIC ACTIVITY: Selective cleavage of Gln-|-Gly bond in the polivirus polyprotein. In other picornavirus reactions Glu may be substituted for Gln, and Ser or Thr for Gly.

CATALYTIC ACTIVITY: Selective cleavage of Tyr-|-Gly bond in the picornavirus polyprotein. In other picornavirus reactions Glu may be substituted for Gln, and Ser or Thr for Gly.

CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA)(N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL I EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VIVO3, AND VP4.

PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PLOTENANGE BETWEEN VP4 AND VP2 IS AUTOCATALYTIG; VP1/P2A IS CATALYZED BY PA5, ALL OTHER CLEAVAGES ARE CATALYZED BY PSIS ALL OTHER CLEAVAGES ARE CATALYZED BY PSIS ALL OTHER CLEAVAGES TO PEPTIDASE FAMILY C3.

SIMILARITY: P3A PROTEASE BELONGS TO PEPTIDASE FAMILY C3.

SIMILARITY: P3C PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
